Data Protection enables enterprise wide protection for legacy and modern workloads, allowing companies to simplify and automate data protection across physical, virtual and cloud environments while retaining exceptional scalability. Automated disaster recovery with centralized bare metal recovery can be activated with a single click. Enterprise grade security is built-in to help minimize risk associated with data breaches and increase security of backup data. Predictive analytics, reporting and monitoring allow companies to track and manage SLAs for critical applications, and orchestration automation enables to automate backup processes, saving time and increasing reliability.
